2025 Total Reach Highlights

China Country Office MEAL Team

June 2025

Save the Children

AGENDA

- Part 1: 2025 Data Highlights (Direct Reach, Children, Humanitarian, SOF, Indirect)
- Part 2: Total Reach Reporting — Practical Reminders (PRIME / Logframe / IPTT)
- Q&A

Save the Children

2025 Total Reach at a Glance

215,188 ▲ +11% Direct Reach

152,881 ▲ +64% (71% of total) Children beneficiaries

8,077 ▼ –78% Humanitarian Reach

25 → 35 SOF count

576,432 ▼ –99% * Indirect Reach

** Indirect Reach drop reflects tighter methodology, not reduced impact. Org–level reporting no longer counts Indirect Reach.*

Save the Children

Total Reach Overview: Direct vs. Indirect

Direct Reach (reported at org level)

- 2024: 194,171 → 2025: 215,188 (+11%)
- Primary beneficiaries counted through PRIME; methodology consistent year-on-year.

Indirect Reach (award level only from 2025)

- 2024: 45,909,974 → 2025: 576,432 (~-99%)
- The drop is driven by: (1) 2024 included a large online Protection campaign; (2) stricter counting rules applied from 2025 onward.
- Org-level Total Reach report no longer aggregates Indirect Reach — but award-level reports still require it.

Implication: Do not compare 2024 vs 2025 Indirect Reach as a performance signal. Context explanation is mandatory when presenting to donors.

Save the Children

Direct Reach: 2024 vs. 2025

194,171 2024 Direct Reach

215,188 ▲ +11.0% 2025 Direct Reach

What's driving the increase?

- More active SOFs: 25 (2024) → 35 (2025), broadening total coverage.
- Growth concentrated in Education projects with higher child beneficiary ratios.
- Humanitarian reach declined significantly (see slide 8), partially offsetting gains.

Calculation: (215,188 – 194,171) / 194,171 = +10.8%, rounded to +11%.

Save the Children

Children Beneficiaries: Scale & Share

93,097 (48% of Direct Reach) 2024 Children

152,881 ▲ +64.2% | 71% of Direct Reach 2025 Children

What's behind the growth?

- Education projects are the primary driver — beneficiaries are predominantly school-age children.
- Poverty projects target 18—24 year-old youth; child count from these is intentionally low by design.
- 71% share signals a significant programmatic shift toward child-focused programming.

Note: Child vs. non-child breakdown follows project design logic. Poverty SOF child counts should not be compared directly with Education SOF counts.

Save the Children

Children Reach by Member: Notable Changes

Top Growth Members

+315% Largest absolute growth in child reach Denmark

+88.7% Sustained growth across Education portfolio United States

Notable Decline

–63% Significant reduction in child beneficiaries Hong Kong

Only representative members with provided data are shown. Denmark growth reflects new/expanded Education SOFs. Hong Kong reduction warrants project–level review.

Save the Children

Humanitarian Reach: Context Behind the Drop

37,161 2024 Humanitarian Reach

8,077 ▼ –78.3% 2025 Humanitarian Reach

Why the large drop?

- 2024 figure was inflated by earthquake emergency response — a one-off, large-scale activation.
- 2025 reflects a return to baseline humanitarian programming levels.
- This is NOT a performance failure — it is a context-driven change. Communicate clearly in donor reports.

Calculation: (8,077 – 37,161) / 37,161 = –78.3%. Always pair this figure with context note on earthquake response.

Save the Children

SOF Count: Growing Portfolio Complexity

25 2024 Active SOFs

35 ▲ +40% 2025 Active SOFs

What this means for teams

- More SOFs = more diverse funding sources = broader coverage potential.
- Each SOF requires its own PRIME reporting, IPTT maintenance, and KPI tracking.
- Coordination and de-duplication workload increases — ensure MEAL Focal is looped in for joint activities.

With 35 SOFs, year-end de-duplication is more complex. Flag any joint activities NOW so they can be tracked properly.

Save the Children

Indirect Reach: Methodology Change (Reference)

45,909,974 2024 Indirect Reach

576,432 ▼ ~–99% (methodology, not performance) 2025 Indirect Reach

Two reasons for the dramatic drop

- Activity difference: 2024 included a Protection group large-scale online campaign with millions of impressions.
- Stricter counting: 2025 requires de-duplicated social media reach (unique IP) and video views multiplied by completion rate.

Key rule from 2025

- Org-level Total Reach report: Indirect Reach is NO LONGER included.
- Award-level reports: Still required. Use de-duplicated social media data where available.

Social media: Use backend unique-visitor counts, not raw impressions. Video: multiply total views by completion rate percentage.

Save the Children

TR Reporting: PRIME, Logframe & Coverage

Step 1 — All Direct Reach goes through PRIME from 2025

- Every beneficiary count must be entered in PRIME — no off-system tracking counts toward TR.
- If your logframe TR indicators don't cover all actual beneficiaries, gaps must be resolved — contact your MEAL Focal.

Step 2 — Identify TR indicators correctly

- Look for indicators with 'Country TR' in the suffix. These are your Total Reach markers.
- Always select the most granular geographic level when entering data in PRIME.

Step 3 — New logframes: at least 1 TR indicator per sub-theme

- Every sub-theme in a new logframe must have at least one TR-tagged indicator. Check at proposal stage.

If you are unsure whether your logframe TR indicators cover all activities, schedule a check-in with your MEAL Focal before Q2 reporting.

Save the Children

IPTT: Filling TR Indicators Correctly (Step 4)

Rule: All three fields are mandatory for TR indicators in IPTT

Required Fill with 0 if no pre-project data Baseline

Required Set at proposal stage; update if scope changes Target

Required Enter 0 if no activities occurred this period Actual

Common mistake to avoid

- Leaving fields blank is NOT the same as entering 0 — blank fields create data quality flags and will be returned.
- Do not wait until year-end to fill IPTT — enter actuals each reporting period.

Blank ≠ Zero. A blank field signals 'not reported'; a zero signals 'reported, no activity'. The distinction matters for aggregation.

Save the Children

Cumulative vs. Incremental: Which to Report?

PRIME TR attribute is always INCREMENTAL

- Example: Y1 = 30 new people, Y2 = 10 new people → LOA total = 40.

Challenge: Your logframe may use CUMULATIVE logic

- Example: Same 30 teachers trained in both Y1 and Y2 → Logframe LOA = 30 (not 60).

Two valid approaches — choose one and document it

- Option A — Report new additions only: Aligns with donor report logic. Y2 entry = 0 (no new people).
- Option B — Report actual reach each year: Aligns with TR report. Y2 entry = 30 (same people, new period).
- Either way: maintain a register distinguishing 'actual reach this year' vs. 'logframe-required reach'.

Not sure which to use? Ask your project MEAL Focal. Inconsistency between donor reports and TR reports must be documented and reconcilable.

Save the Children

De-duplication & Joint Activities (Steps 6–7)

Step 6 — De-duplication happens at indicator level

- A person counted under multiple indicators in the same project is de-duped when aggregating to project total.
- If two or more projects jointly organize an activity AND both report it separately — flag it now. Year-end de-duplication requires evidence.
- Keep a joint-activity log: date, activity, projects involved, headcount reported by each.

Step 7 — Indirect Reach counting rules (award level)

- Social media: Use backend de-duplicated figures (unique IP/account), not raw impression counts.
- Video: Multiply total view count by the completion rate percentage.
- Org-level reporting: Indirect Reach is excluded. Award-level reporting: still required.

Year-end de-duplication session will be coordinated by MEAL team. Start collecting joint-activity records now to avoid last-minute scrambles.
